

## Workshop & Maintenance Management

### Dealer Services

Organisations operating fleets in challenging environments will be concerned about the level of service that the local dealer can provide; whether they are using correct oils or fitting genuine spare parts or if their technicians have adequate skills and training. In some cases local dealers will have adequate facilities but may be lacking the necessary spares, equipment, management controls and processes required to provide a professional service.

As part of their Workshop and Maintenance Management service, Lodi will carry out an assessment of local dealer services, identify the best and, where agreement can be reached with the dealer, provide a routine quality control and monitoring service to ensure acceptable service and repair standards are established and maintained.

### Customer Workshop Management

Lodi can also provide a project management service to organisations running or planning to run their own vehicle workshops or service programmes.

This service will include the specifying and overseeing of workshop construction, the installation of equipment, recruitment and training of skilled operatives and the installation and commissioning of workshop management systems. The service can also include the establishment of complete parts stocking facilities and the integration of inventory management systems.

### Lodi Workshop Systems - Container Workshops (CWS)

The CWS range of flexible self-contained Workshop Systems have been designed by Lodi, working with specialist engineering companies, to be deployable within two to three weeks. The system is based on container modules supporting a light, durable, easy-to-assemble roof structure. Each module is pre-equipped to provide parts and consumable stores, clean workshop, office, training facilities and accommodation.

Depending on the number of containers used and how they are arranged, the workshop can provide services for light vehicles, trucks and construction equipment and can be configured for fleets from 200 to 1000 vehicles. Services are provided and the system requires only a water supply to be fully functional.

In cooperation with a finance partner, we have developed 12, 24 or 36 months Leasing programmes for the CWS range which cover the facility plus options such as Resourcing and Fleet Management systems

### The Lodi Centre

Where there are neither adequate local dealers nor in-house facilities, Lodi will aim to establish a high quality sub-contract workshop and maintenance operation with a local partner or set up an independent Lodi facility.

The establishment of dedicated local facilities and the provision of a full range of services will be dependent on normal business parameters such as costs, fleet sizes and the level of local demand for services and will follow a comprehensive feasibility study.
